Procedural Guidelines for the Treatment and Prophylaxis of Suspected Influenza in In-Patient Units

1. Introduction

1.1 This Procedural Guideline reflects Public Health England (PHE) recommendations on Antiviral prophylaxis and treatment of influenza (PHE guidance on use of antiviral agents for the treatment and prophylaxis of seasonal influenza Version 7.0, October 2016 and the PHE Winter Flu Plan 2017-18) as well as NICE guidance on treatment and prophylaxis.

1.2 It is intended as a prescribing and administration guide for those clinicians who find themselves faced with the possibility of an influenza outbreak on an inpatient ward within the Trust. Clinicians may wish to seek specialist advice about the use of antiviral medicines from local infection specialists for an individual patient.

1.3 Antiviral medicines may be prescribed at any time on an inpatient ward for at risk patients with suspected seasonal influenza infection.

1.4 The Trust recognises that in following these Procedural Guidelines then staff prescribing and administering antiviral medicines may be acting outside of NICE guidance on antivirals and the Product Licence for these medicines.

2. Scope of this Procedural Document in Prophylaxis and Treatment

2.1 This Procedural Guideline is intended for use in Trust In-Patient units for the management of any at risk patient where influenza is suspected or confirmed at any time. **NB: Patients treated within the community setting should follow the advice of the CMO letter concerning circulating influenza.**

2.2 Treatment of Complicated influenza usually requires acute hospital admission and is outside of the scope of this guideline.

2.3 The use of Zanamivir is outside of the scope of this guideline as inhaled zanamivir via Diskhaler may not be an effective delivery route in some patients, such as those with severe underlying respiratory disease. Patients for whom oseltamivir is contraindicated should be treated on an individual clinical basis with referral to acute hospital as required.

2.4 Refer to the PHE Guidance for further information on:
   - Complicated influenza
   - Patients with Severe immunosuppression
   - suspected or confirmed Oseltamivir resistant influenza
3. Definitions

**Uncomplicated influenza**: Influenza presenting with fever, coryza, generalised symptoms (headache, malaise, myalgia, arthralgia) and sometimes gastrointestinal symptoms, but without any features of complicated influenza.

**Complicated influenza**: Influenza requiring hospital admission and/or with symptoms and signs of lower respiratory tract infection (hypoxaemia, dyspnoea, lung infiltrate), central nervous system involvement and/or a significant exacerbation of an underlying medical condition.

**At-risk population**: those individuals with any of the following:
- Neurological, hepatic, renal, pulmonary and chronic cardiac disease.
- Diabetes mellitus.
- Severe Immunosuppression.
- Age over 65 years.
- Pregnancy (including up to two weeks postpartum)
- Children under 6 months of age
- Morbid obesity (BMI >=40).

**Severe immunosuppression**
Examples of severe immunosuppression relevant to this guidance are given below. Degrees of immunosuppression are difficult to quantify and individual variation exists, therefore this list is not comprehensive.

a. Severe primary immunodeficiency.
b. Current or recent (within six months) chemotherapy or radiotherapy for malignancy.
c. Solid organ transplant recipients on immunosuppressive therapy.
d. Bone marrow transplant recipients currently receiving immunosuppressive treatment, or within 12 months of receiving immunosuppression.
e. Patients with current graft-versus-host disease.
f. Patients currently receiving high dose systemic corticosteroids (equivalent to ≥40 mg prednisolone per day for >1 week in an adult, or ≥ 2mg/kg/day for ≥1 week in a child), and for at least three months after treatment has stopped.
g. HIV infected patients with severe immunosuppression (CD4<200/μl or <15% of total lymphocytes in an adult or child over five; CD4< 500/μl or <15% of total lymphocytes in a child aged one to five; expert clinical opinion in a child aged under one).
h. Patients currently or recently (within six months) on other types of highly immunosuppressive therapy or where the patient’s specialist regards them as severely immunosuppressed.

Some influenza subtypes are associated with a greater risk of developing oseltamivir resistance. The risk of resistance is greatest in people who are severely immunosuppressed. The selection of first line antivirals in severely immunosuppressed individuals should take account of the subtype of influenza causing infection, or if not yet known, the dominant strain of influenza that is circulating during the current influenza season. **Therefore, patients with severe immunosuppression should be admitted to acute hospital care.**
4. **Formulary**

The following medicines may be held in stock in some In-patient units for Influenza treatment and prophylaxis (check if this is the case for your ward/unit):

- Oseltamivir 75mg and 30mg Capsules;
- Oseltamivir Oral suspension, 30mg in 5mL for infants under one year only.
- Where a patient has swallowing difficulties or an enteral tube in situ, capsules can be opened and the contents mixed with a small amount of sweetened food, such as sugar water or chocolate syrup, just before administration.

5. **Treatment of Suspected or Confirmed Uncomplicated Influenza (except severely immunosuppressed patients)**

For the at risk population, including pregnant women:

<table>
<thead>
<tr>
<th>Patient Type</th>
<th>Weight (kg)</th>
<th>Dose</th>
<th>Frequency</th>
<th>Duration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adults and children aged 13 years and over with normal renal function</td>
<td>Not applicable</td>
<td>75mg</td>
<td>Twice daily</td>
<td>5 days</td>
</tr>
<tr>
<td>Children aged 1 to 12 years</td>
<td>10 to 15 kg</td>
<td>30mg</td>
<td>Twice daily</td>
<td>5 days</td>
</tr>
<tr>
<td></td>
<td>&gt; 15 to 23kg</td>
<td>45mg</td>
<td>Twice daily</td>
<td>5 days</td>
</tr>
<tr>
<td></td>
<td>&gt; 23 to 40kg</td>
<td>60mg</td>
<td>Twice daily</td>
<td>5 days</td>
</tr>
<tr>
<td></td>
<td>&gt; 40kg</td>
<td>75mg</td>
<td>Twice daily</td>
<td>5 days</td>
</tr>
<tr>
<td>Infants aged 0 to 12 months</td>
<td>Not applicable</td>
<td>3mg/kg/dose</td>
<td>Twice daily</td>
<td>5 days</td>
</tr>
</tbody>
</table>

- Note: Dose adjustment may be necessary for patients with impaired renal function – see Table 1, section 8.

- Do not wait for laboratory confirmation.

- Start treatment as soon as possible, and within 48 hours of onset. (Or later at clinical discretion - there is limited evidence that treatment may reduce the risk of mortality up to five days after onset. Commencement of treatment more than 48 hours after onset is an unlicensed use of Oseltamivir and clinical judgement should be exercised).

- See Table 1, section 8 below for dosage adjustment in renal dysfunction

- Prescribe medication on *Influenza Outbreak Treatment Prescription & Administration Record Chart for In-Patient Units* or *Influenza Outbreak Prophylaxis (Prevention) Prescription & Administration Record Chart for In-Patient Units* as applicable. (see appendices 1 and 2)

6. **Treatment of complicated influenza or severely immunosuppressed patient** – admit to **Acute Trust**
7. Post-Exposure Prophylaxis of Suspected or confirmed Influenza Contact cases

For patients at risk of complicated influenza (but excluding severely immunosuppressed patients) NB: Therapy must be started within 48 hours of last contact

<table>

</tr>
</tbody>
</table>

- Note: Dose adjustment may be necessary for patients with impaired renal function – see Table 1, section 8.
- Previous influenza immunisation does not preclude post exposure prophylaxis\(^{(1)}\).
- Exposure to an influenza-like illness is defined as close contact with a person in the same household or residential setting who has had recent symptoms of influenza\(^{(3)}\).
- Consider consulting the local Health Protection Team.
- See below for dosage adjustment in renal dysfunction

8. Dosage Adjustments in Renal Dysfunction

8.1 The choice of dose in renal failure is complicated by the different measures available to describe degree of renal impairment, as well as a lack of specific data in some circumstances. CrCl is used in this document as it is a more accurate measure upon which to make dosing recommendations and is congruent with the manufacturers prescribing information for oseltamivir. The limitations for using eGFR are described in the British National Formulary (\textit{Prescribing in renal impairment; BNF}). CrCL can be estimated in adults by utilising the Cockcroft and Gault equation (See 8.2). Both eGFR and CrCL (using Cockcroft and Gault) assume the patient’s renal function is stable. Clinical judgement will be required where renal function is unstable (i.e. in acute renal failure).

It is recognised that eGFR may be more readily available at the outset of therapy. If this is the only value available then do not delay therapy and prescribe a dose according to eGFR (substituting eGFR for the CrCL figure in the following tables).
<table>
<thead>
<tr>
<th>adults and adolescents aged 13 years and over</th>
<th>Oseltamivir oral Treatment - 5 Days</th>
<th>Oseltamivir oral Prophylaxis – 10 Days</th>
</tr>
</thead>
<tbody>
<tr>
<td>Moderate impairment (CrCL 30-60 mL/min)</td>
<td>30mg BD</td>
<td>30mg OD</td>
</tr>
<tr>
<td>Severe impairment (CrCL 10-30mL/min)</td>
<td>30mg OD</td>
<td>30mg every 48 hours</td>
</tr>
<tr>
<td>Established renal failure (CrCL &lt;10mL/min)</td>
<td>Not recommended</td>
<td>Not recommended</td>
</tr>
<tr>
<td>Haemodialysis</td>
<td>30 mg after each haemodialysis session</td>
<td>30 mg after every second haemodialysis session</td>
</tr>
<tr>
<td>Peritoneal dialysis</td>
<td>30mg once</td>
<td>30mg once weekly</td>
</tr>
</tbody>
</table>

For children aged 0-12 years with renal dysfunction, seek specialist advice.

8.2 Cockcroft and Gault Equation:

Renal Function expressed as Creatinine Clearance (CrCl) can be calculated using the Cockcroft and Gault Formulation:

Estimated Creatinine Clearance in mL/min) = \frac{(140-\text{Age}) \times \text{Weight} \times \text{Constant}}{\text{Serum Creatinine}}

- **Age in years**
- **Weight in kilograms; use ideal body-weight**
- **Serum creatinine in micromol/litre**
- **Constant = 1.23 for men; 1.04 for women**
8.3 Treatment of suspected or confirmed influenza in In-Patient Wards/Units

Suspected or confirmed influenza

Uncomplicated

At risk group

Severely immunosuppressed?

NO

Treat with Oseltamivir within 48 hours of onset, or up to 5 days at clinical discretion (unlicensed)

YES

Refer to acute hospital care

Previously healthy

Complicated

Refer to acute hospital care

Severely immunosuppressed?

NO

Treat with Oseltamivir within 48 hours of onset, or up to 5 days at clinical discretion (unlicensed)

YES

No Treatment

Or

Oseltamivir if prescriber feels that patient is at risk of developing serious complications
8.4 Prophylactic antiviral treatment following a suspected or confirmed influenza cases on an In-Patient Unit.

Suspected or confirmed Influenza cases on the ward/unit

- Patient in at-Risk Group
- does not have symptoms of influenza but another patient on the ward/unit has an influenza-like illness

Severely Immunosuppressed?

NO

Treat with Oseltamivir prophylactic dose within 48 hours (see Table 1 for doses)

YES

Seek specialist advice

DO NOT give prophylactic treatment

Appendix 1
Influenza Outbreak Treatment Prescription & Administration Record Chart For In-Patient Units
This chart is intended for treatment of influenza in this patient if both criteria 1 and 2 apply.

1. Those who have one or more of the following:
   - chronic respiratory disease (including asthma and chronic obstructive pulmonary disease)
   - chronic heart disease
   - chronic renal disease
   - chronic liver disease
   - chronic neurological conditions
   - diabetes mellitus
   - aged 65 years or older
   - immunosuppressed (not severely)
   - pregnancy
   - obesity (BMI ≥ 40)
   - children under 6 months of age

2. The patient presents with an influenza-like illness and can start treatment ideally within 48 hours, or up to 5 days (unlicenced), of the onset of symptoms
